Docket No. 70021220.0031

IN THI: UNITED STATES PATENT AND TRADEMARK OFFICE

Application of:)
KENISON, DALE C. et al.) Group Art Unit 1616
Application No.: 09/589,730) Exammer: Levy, Neil S.
Filing Date: June 8, 2000))
Title: GROWTH FROMOTING PHARMA) CEUTICAL IMPLANT
Hon. Commissioner for Patents	

P.O. Box 1450

Alexandria, Virginia 22313-1450

Dear Sir:

DECLARATION BY WILLIAM G. ZOLLERS

- I am one of the inventors of the subject matter described and claimed in the abovereferenced application.
- 2. This Declaration is being presented by me in furtherance of the prosecution of the abovereferenced application, and demonstrates that the claimed implant functions to improve average daily gain and feed conversion efficiency of food animals in addition to preventing implant site abscesses in food an mals.
- Three studie: were performed to evaluate the efficacy of growth-promoting implants also containing a pellet of a supplemental agent, namely, tylosic tartrate, in feedlot cattle.
- Sanitation procedures used during the studies include removing debris from contaminated ears with a serrated knife or wire brush. Wet ears were washed with clean water then with a disinfectant solution Ears that were clean and dry were implanted without further preparation. Implanter needles were dipped in disinfectant solution in ter each animal and dipped again if contact was made with the animal prior to implanting. Physical debris was removed from needles as necessary using sponges soaked with disinfectant. All implant products were kept in water-proof containers until use.
- Implant site evaluations were conducted by an experienced evaluator who was unaware 5. of the study design or treatment designation. For evaluation, animals were removed from the pen and restrained individually in the feedyard animal handling facility. Implant sites were inspected visually and by palpation.
- Study One v/as conducted at a commercial fee-lyard in Oklahoma and utilized 438 mixed-breed yearling; steers with a mean initial body weight of 361 kg. Steers were obtained as a single group, sorted by body weight (BW) into two blocks of two pens each, and placed on feed.

Docket No. 70021221,0031 Application No. 09/5 39,730

Zollers Declaration

Within each pen, steers received either: (1) a growth promoting implant containing 24 mg estradiol and 120 mg trenbolone acetate; or (2) a growth promoting implant containing 24 mg estradiol, 120 mg trenbolone acetate, and 29 mg tyles in tartrate. Steers were assigned to treatment on an every-other-head basis within each pen wherein the treatment assignment of the first steer in each pen was determined randomly. Cattle were weighed individually on the day of implant. Implant s tes were evaluated 28 days post-implant. Pens were slaughtered 125 days (two heavy pens) or 141 days (two lighter pens) post-implant. Hot carcass weights (HCW) were collected immediately after evisceration. Individual animal average daily gains (ADG) were calculated using the equation: ADG = ((HCW/0.635) - initial BW)/days on feed. In this equation, 0.635 represents the mean dressing percentage of all animals on the study. The results are shown below in Table 1.

Table 1. Results from Study One

	Treatment 1	Treatment 2	P =
Head evaluated	219	219	-
Normal implant	214	218	
Abscessed implant site	4	0	
Missing implant	1	1	
Initial body weight (kg)	360.9	360.2	>0.5
Gain (kg) at 126 or 41 days	236.3	241.2	0.08
ADG (kg) at 126 or 141 days	1.76	1.80	0.07
Hot carcass weight	379.7	382.7	0.08

As shown in Table 1, a low incidence of abscesses was observed. In addition, there were higher body weight gains (>=0.08), higher ADG (P=0.07) and greater HCW (P=0.08) in the group that received Treatment 11.

Study Two was conducted in a commercial research facility in Texas and involved 1475 mixed breed steers with 360 kg initial weight. On day or c, steers were divided into five groups and allotted from within each group in cycles of not more than 10 head per pen into 15 experimental pens. Pens contained between 89 and 111 steers each. Each allotment group was equally represented by % in each pen. Experimental pens were located in five geographic blocks of three pens each. After allotting cattle to pens, pens were randomly assigned to three treatments (one pen per block for each treatment). Experimental treatments were:

Table 2. Experimen al Treatment Descriptions.

	Initial Implant	Re-implant
Treatment One:	24 mg estradiol 120 mg trenbolone acetate	None
Treatment Two:	24 mg estradiol 120 mg trembolone acetate 29 mg tylosin tartrate	None
Treatment Three:	8 mg estradiol 40 mg trenholone acetate	8 mg estradiol 40 mg trenbolone acetate 29 mg tylosin tartrate

Docket No. 7002122).0031 Application No. 09/539,730

Zollers Declaration

Treatment three was re-implanted on day 50 of the 126 day study. Cattle were weighed as pens initially and at the conclusion of the feeding period. Feed was weighed and recorded prior to delivery. Implant sites were inspected at harvest at the slaughter facility. Carcass data were recorded after a 24 10ur chill. The results are shown below in Table 3.

Table 3. Results of Study Two.

	Treatment 1	Treatment 2	Treatment 3	Probability > F	
			<u> </u>	T1 v. T2	T2 v. T3
Proper implant (%)	97.8	99.4	95.4	NA	NA
Improper (%)	2.2	0.6	0 15	0.03	1.00
Abscessed (%)	0.4	0.2	0.1)	NA	NA
Pellets missing (%)	0.8	0.2	0.0	NA	NA
Implant missing (%)	0.6	0.2	0.2	NA	NA
ADG (kg)	1,69	1.71	1.69	0.06	0.11
Feed/gain	5.67	5.60	5.:2	0.04	0.03
HCW (kg)	370.9	373.6	372.3	0.11	0.03

As shown in Table 1, steers implanted with Treatment 2 had fewer implant site defects (P=0.03) despite a low incidence (2.2%) of implant site defects in the Treatment 1 group. Groups which received Treatment Two or Treatment Three had similar incidences of implant site defects. ADG and F/G of pe is that received Treatment 2 were improved compared to those that received Treatment 1 and the initial implant of Treatment 3. The re-implant step of Treatment 3 also resulted in further improvement in F/G (P=0.03).

Study Three was conducted at a commercial feedyard in Kansas and utilized 532 mixed-breed yearling steers with a mean initial body weight of 363 kg. Steers were obtained as a single group, sorted by body weight into two blocks of four pens each, and placed on feed. Within each pen, steers received either: (1) a growth-promoting implant containing 24 mg estradiol and 120 mg trenbolone acetate; or (2) a growth-promoting implant containing 24 mg estradiol, 120 mg trenbolone acetate, and 29 mg tylosin tartrate. Steers were assigned to treatment on an every-other-head basis within each pen with the treatment assignment of the first steer in each pen determined randomly. Pens were slaughtened 127 days (nvo pens), 147 days or 156 days post-implant as determined by the feedyard manager. Cattle were weighed individually on the day of implant. Implant sites were inspected at harvest at the slaughter facility. HCW were collected immediately after exisceration. Individual ADG were calculated using the equation: ADG = ((HCW/0.644 - initial BW)/days on feed. In this equation, 0.644 represents the mean dressing percentage of all animals in the study. The results are shown below in Table 4.

Table 4. Results of Study Three

	Treatment 1	Treatment 2	P =
Head evaluated	263	259	
Total implant site de ects (%)	2.3	2.:!	>0.5
Initial body weight (1:g)	368.8	258.3	0.49
Gain (kg) at 139 day:	220.3	224.4	0.10
ADG (kg) at 139 days	1.58	1 (1	0.09
Hot carcass weight (1:g)	379.4	381.8	0.14

Docket No. 70021220.0031 Application No. 09/5 39,730

Zollers Declaration

As shown by Table 4, there was a tendency for higher ADG (P=0.09) in the group that received Treatment 2. Differences in body weight gain (P=1.10) and HCW (P=0.14) were also significant.

In ongoing field evaluations of implant sites in commercial feedvards using a growthpromoting implant containing tylosin tartrate, experienced personal have palpated 164,656 implant sites with the following results:

Table 5. Results of Field Evaluations of Implant Sites.

	Growth-promotant w/o tylosin tartrate	Growth-promotant with tylosin tartrate
Head evaluated	111,651	53.005
Abscessed (%)	2.49	0.59

These evaluations were conducted upon customer request and do not represent a designed comparison of products. Nonetheless, the abscess rate with growth promotant and tylosin tartrate is 76% lower than without tylosin tartrate.

- As these sti dies demonstrate, an implant containing a growth-promotant in synergistic 10. combination with tylosin tartrate results in better animal performance, feed efficiency, and fewer abscesses than with an implant containing growth-promerants alone. While these studies were conducted with estradiol, trenbolone acetate and tylosia tartrate, it is expected that studies conducted using of ler active and supplemental agents as described and claimed in the present application would s mergistically combine to demonstrate similar results.
- 11. I further declare that all statements made herein of my own knowledge are true and all statements made on information and belief are believed to be true, and further that these statements were made with the knowledge that willful, false statements and the like are punishable by fine or imprisonment, or both, under §1001 if Title 18 of the United States Code, and such willful, filse statements may jecpardize the vilidity of any patents issued from the patent application.
